### 3880 PRODUCT DESCRIPTION

The 3880 is a Direct Access Storage Control Unit providing attachment capabilities for the 3370 and 3340/3344 file drives to system 4341.

The 3880 control unit, incorporating the latest technological concepts, consists of four functional areas packaged on one 4 x 2 gate:

- Storage Director (2 per 3880)
- Maintenance/Power Control Module
- MPL (Microprogram Load) file (33FD)
- Power

Each 3880 Storage Director contains a micro controller to perform instruction processing, and control storage which has microcode modules required for Channel/Device connections.

The 3880 has the capability for attaching of up to four strings of 3370 or 3340/3344 file drives per director (8 strings per control unit). 3370 strings cannot be inter-mixed with 3340/3344 strings on the same director.

### General Characteristics

The 3880 logic is designed primarily in high density Large Scale Integration Circuitry (LSI), functionally packaged in pluggable units.

The 3880 provides:

- CONTROL UNIT RETRY** to recover from any control unit and file errors without intervention at the system level
- CONTROL UNIT LOGGING** is also supported where storage subsystem errors and statistical information, recorded in the control unit, is periodically posted to Out Board Record/Statistical Data Record
- SINGLE BIT MEMORY CORRECTION** is incorporated so that a single bit error will not prevent normal operation from continuing
- POWER SEQUENCER/MONITOR (PSM)** constantly monitors the 3880 voltages, circuit protectors and thermals. Power supply components are monitored for under/over voltage and over current while logic boards are sampled for under voltage. Any fault detected will sequence down the 3880 and record a fault symptom code for problem isolation

### Optional Features

- Two Channel Switch  
This feature allows two channel paths to each storage director (4 channel paths per 3880)
- Remote Enable/Disable  
This feature relocates the enable/disable switches from the operator panel to a remote console

### Programming Support

Programming support is provided in DOS/VSE and VM /370 for 3370 attachment and DOS/VS, VS1, VM for 3340/3344 attachment.

## General Characteristics

The 3880 logic is designed primarily in high density Large Scale Integration Circuitry (LSI), functionally packaged in pluggable units.

The 3880 provides:

- CONTROL UNIT RETRY** to recover from any control unit and file errors without intervention at the system level
- CONTROL UNIT LOGGING** is also supported where storage subsystem errors and statistical information, recorded in the control unit, is periodically posted to Out Board Record/Statistical Data Record
- SINGLE BIT MEMORY CORRECTION** is incorporated so that a single bit error will not prevent normal operation from continuing
- POWER SEQUENCER/MONITOR (PSM)** constantly monitors the 3880 voltages, circuit protectors and thermals. Power supply components are monitored for under/over voltage and over current while logic boards are sampled for under voltage. Any fault detected will sequence down the 3880 and record a fault symptom code for problem isolation

## Optional Features

- Two Channel Switch**  
This feature allows two channel paths to each storage director (4 channel paths per 3880)
- Remote Enable/Disable**  
This feature relocates the enable/disable switches from the operator panel to a remote console

## Programming Support

Programming support is provided in DOS/VSE and VM /370 for 3370 attachment and DOS/VS, VS1, VM for 3340/3344 attachment.

## Maintainability/Serviceability

- Maintenance Device (MD)**  
The MD is a portable onsite tool used as the CE's interface to the 3880. It combines the functions of a CE Panel and MAP package. The MD includes a microprocessor, diskette loading device, and hand held keyboard display. The customized diskette is EC controlled and will be shipped with each 3880. The MD provides:
  - Automatic execution of microdiagnostics for recreation and isolation of failure
  - High speed analysis of symptom codes from console messages and error logs for FRU isolation
  - Routines and procedures for machine checkout.
- Maintenance Information Manuals (MIM)**  
Contain support level documentation that supplement the MD's MAP package
- Environment Recording, Edit and Print (EREP1)**
- Tracer/Dumper Micro**  
A tool to aid in problem isolation when no hardware error is evident. Runs concurrent with customer operation when invoked by the CE
- On Line Tests (OLTs)**  
A channel interface OLT and a Tracer/Dumper Retrieval OLT
- Hardcore Micro Tests**  
A series of tests initiated on each storage director with initial power up to thoroughly checkout the 3880 hardware
- New System Test (NST)**

## CE Career Path

This is a DP CE career path product.
